

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

#### Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

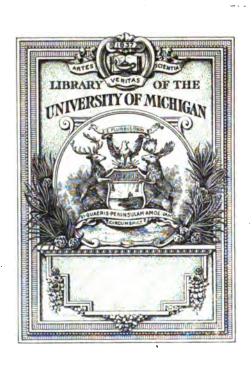

We also ask that you:

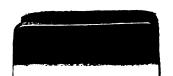

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + Refrain from automated querying Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

#### **About Google Book Search**

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at http://books.google.com/

Gedruckt bei Leopold Sommer.

In Commission bei J. B. Wallishausser.

### Vorwort.

Die Änderung des Formates, welche aus Rücksichten der Raumersparniss und bequemeren Handhabung nach dem Vorgange ähnlicher Werke auch bei den Annalen der Wiener Sternwarte zeitgemäss erschien, begründet eine neue Folge dieses Jahrbuches.

Der gegenwärtige Band, in der vollständigen Reihe der XXXV., und der folgende, bereits unter der Presse befindliche, geben einen aus den ersten Argelander'schen Zonen abgeleiteten Sternkatalog, dessen Anfertigung sich Herr W. Oeltzen zur rühmlichen Aufgabe gestellt und mit unermüdlichem Eifer beendigt hat. Als Herr Oeltzen im Spätherbste 1850 in das Personal des hiesigen Observatoriums trat, hatte er bereits einige Monate sich mit diesem Gegenstande beschäftigt. Die höchst umsichtige Anlage des Ganzen bestimmte mich sofort, ihn zunächst zur Vollendung dieses Theiles weiterer Untersuchungen, in denen er begriffen ist, zu ermuntern und ihm hierbei mit allen mir zu Gebote stehenden Mitteln um so mehr zu Hülfe zu kommen, als damit eine wichtige Vorbereitung für das schon früher von unserer Anstalt gefasste und eben angebahnte Vorhaben ergänzender Zonenbeobachtungen geliefert wird. Des unleugbaren Vortheiles wegen, der bei solchen Unternehmungen in der völlig gleichmässigen Behandlungsweise des Stoffes durch einen und denselben Rechner und in der möglichsten Förderung der Arbeit liegt, enthob ich Herrn Oeltzen so viel thunlich der Theilnahme an den allgemeinen Geschäften der Anstalt und wies ihm für die mechanischen Ausführungen einen Hülfsarbeiter zu, über den ich durch die liberale Unterstützung Sr. Excellenz des Herrn Unterrichts-Ministers, Leo Grafen von Thun, bei zweckmässigerer Vertheilung unserer Dotationen verfügen konnte. Herr Oeltzen benutzte die ihm gebotene Gelegenheit auf das beste und brachte in verhältnissmässig sehr kurzer Zeit die weitläufige Arbeit auf eine Weise zu Stande, die meines Erachtens nichts zu wünschen übrig lässt.

Wenn die nach gemeinsamer reiflicher Überlegung gewählte Form, in welcher die Resultate hier erscheinen, in manchen nicht unwesentlichen Puncten von der bisher bei Sternkatalogen üblichen Anordnung abweicht, so glaube ich doch aus den von Herrn Oeltzen in der Einleitung auseinanderzusetzenden Gründen dem Urtheile der Astronomen auch hierüber mit Beruhigung entgegensehen zu können. Zum Theile in dieser Beziehung sei mir noch die Bemerkung erlaubt, dass diese unsere Publication keineswegs bezweckt, das treffliche Original, welches sie bearbeitet, gleichsam zu verdrängen, sondern nur dessen Benutzung erleichtern und übersichtlicher machen soll, daher dieselbe auch vorsätzlich in möglichst lebendigem Zusammenhange mit dem ursprünglichen Werke erhalten wurde, das wir uns dabei immer als zur Hand und im Gebrauche dachten. Nur so hofften wir mit dem vorliegenden Kataloge der Authenticität von Folgerungen aus Argelander's grosser Arbeit keinen Abbruch zu thun.

Erfreut sich diese Veröffentlichung des Beifalles meiner Collegen, so dürfte von unserer Anstalt in nächster Zukunft Ähnliches weiter unternommen werden.

WIEN, 18. Januar 1852.

Littrow.

Erste Abtheilung.

(0<sup>h</sup> bis 11<sup>h</sup> 34<sup>m</sup>).

# Einleitung.

Die Durchmusterung des nördlichen Himmels zwischen 45 und 80 Grad der Declination, welche Argelander in den Jahren 1841 bis 1844 in Bonn ausgeführt, bildet eine der grössten und dauerndsten Grundlagen unserer Kenntniss des gestirnten Himmels. Die Beobachtungen sind fast ganz in der Form von Originalbeobachtungen gegeben, so dass ihre Benutzung eine jedesmalige Reduction der beobachteten Positionen auf die mittlern für eine bestimmte Epoche erfordert. So einfach und sicher nun auch diese durch die beigefügten Tafeln geschehen kann, so war doch die Reduction sämmtlicher Beobachtungen und die Zusammenstellung derselben in einen nach der Rectascension geordneten Katalog wünschenswerth. Ausser dem Vortheile des leichtern Auffindens eines fraglichen Sternes und der sofortigen Entscheidung, ob derselbe überhaupt in den Beobachtungen vorkommt oder nicht, sowie dem, der jedesmaligen Rechnung überhoben zu sein, ist der Katalog ein Bedürfniss, wenn es sich in Zukunft um neue Beobachtungen derselben Sterne oder um Ausfüllung der noch vorhandenen Lücken handelt; endlich musste die Katalogisirung selbst Veranlassung werden zur Entdeckung von Fehlern in den Originalbeobachtungen.

Der gegenwärtige Band bildet die erste Hälfte dieses Katalogs, über dessen Berechnung, Einrichtung und Benutzung ich hier noch das Nothwendigste folgen lasse.

Was die Erstere anbetrifft, so glaube ich, hier in Kurzem das Verfahren anführen zu müssen, dessen ich mich dabei bedient habe, damit darnach der Grad von Vertrauen zu beurtheilen ist, welches den Resultaten zu schenken.

Die Reduction setzt sich bekanntlich sowohl für die Rectascension, als Declination aus zwei Gliedern zusammen:  $k+k'\frac{\delta-D}{100}$  und  $d+d'\frac{\delta-D}{100}$ , wobei die Werthe von k, k', d und d' mit dem Argumente der "beobachteten Durchgangszeit" aus den Reductionstafeln genommen werden. Diese gehen von 10 zu 10 Zeitminu-

ten und ist also bei den meist nicht grossen Differenzen von k und ddie Interpolation ohne Mühe geschehen; der regelmässige Fortgang dieser Werthe für die aufeinander folgenden Nummern einer Zone lässt kaum einen Fehler in ihrer Bestimmung zu. Für die beiden Glieder, welche die Factoren k' und d' enthalten, ist dieselbe Sicherheit auf folgende Weise erreicht. Zuerst wurden die Differenzen der auf einander folgenden Declinationen, letztere in ganzen Minuten abgerundet, genommen, die Werthe  $\frac{\delta - D}{100}$  aber, bis auf Hundertel-Minuten, nur für einige Nummern in jeder Zone unmittelbar bestimmt, woraus sich die übrigen mit Hülfe der schon gebildeten Differenzen ergaben. Aus ihrem Vorzeichen wurde das von  $\frac{\delta - D}{001} k$ , und aus diesen das von  $\frac{\delta - D}{100} d$  abgeleitet, dann die letzteren mit denen zon  $\delta - D$ denen von  $\frac{\delta - D}{100}$  verglichen, die, je nach den Zeichen von k und d, dieselben oder die entgegengesetzten sein mussten, im Allgemeinen dieselben, da k' fast immer negativ und d' positiv ist. Die Produkte von  $\frac{\partial -D}{100}$  mit k' und d' wurden dann sehr leicht aus kleinen Produktentafeln erhalten. Da k' und d', also auch ihr Verhältniss, sich im Laufe einer Zonenbeobachtung nur wenig ändert, so sieherte endlich noch eine flüchtige Vergleichung der Werthe  $\frac{\delta - D}{100} k'$  und  $\frac{\delta - D}{100} d'$ , da sie immer das Verhältniss von k' zu d' zeigen mussten, gegen grössere Fehler.

In den nördlicheren Zonen, welche zwei verschiedene D enthalten, war es nöthig, auf geeignete Weise diejenigen Sterne, welche dem einen D am nächsten liegen, in der Berechnung ganz von denen zu trennen, welche zu dem andern D gehören, wodurch das beständige Überspringen von der einen Reductionstafel zur andern vermieden ward. Die Rechnung ist sonst ganz die schon erwähnte, nur dass für die Zone 70-74 Grad in der Rectascension noch das Glied von meist geringem Betrage  $(k'_1-k')\frac{(\delta-D)^2}{100.240}$  und zwar aus einer kleinen Tafel zu entnehmen war, welche  $\delta-D$  und die verschiedenen vorkommenden Werthe von  $k'_1-k'$  zu Argumenten hatte. Das Zeichen desselben ist das von  $k'_1-k'$ . Die nördlichste Zone 74-80 Grad enthält ausser  $\frac{\delta-D}{100}$  k' noch das Glied

$$\frac{(\delta - D)^{2}}{100^{2}} k' + (k''_{1} - k'') \frac{(\delta - D)^{2}}{54.10^{5}},$$

dessen beide Theile jeder für sich aus zwei den frühern ähnlichen Tafeln genommen wurden. Da das Zeichen des ersten Theils das von k'', das des zweiten dasselbe oder das entgegengesetzte von  $k''_1 - k''$ , je nachdem  $\delta - D$  positiv oder negativ, so liessen sich die Vorzeichen zuerst richtig bestimmen und hernach die Zahlenwerthe hinzufügen.

Nachdem so alle einzelnen Theile gebildet waren, aus denen sich die Reduction auf 1842 zusammensetzt, wurden dieselben in eine Summe vereinigt. Hiebei war am leichtesten ein Fehler in der Annahme des bei dem Fortgange in der Zone beständig wechselnden Zeichens derjenigen Glieder möglich, welche die Potenzen von  $\delta - D$  enthalten.

Für die nördlichste Zone, wo 3 Potenzen von  $\delta - D$ , also für die Rectascension vier Glieder zu vereinigen waren, ist diese Summirung zweimal unabhängig von einander ausgeführt, für die übrigen nur einmal.

Die auf 1842 reducirten Positionen wurden nun noch dadurch geprüft, dass ich mir die Zonenbeobachtungen vorlesen liess, mit denen dann die von mir im Kopfe gemachte Reduction von der angesetzten Position auf die Zonenbeobachtung übereinstimmen musste. Die dabei nicht entdeckten Fehler können viel leichter grössere, von z. B. 10 Zeitsecunden, 1 Bogenminute etc. sein, als kleinere, darum aber auch weniger schaden.

Argelander gibt Seite XXVII u. f. der Einleitung zu den Beobachtungen, eine Reihe Verbesserungen, welche noch an mehrere Reductionstafeln des Textes anzubringen sind, wie sich dieselben aus eister genauern Untersuchung einzelner Zonen, aus Sternen, die in mehreren Zonen gemeinschaftlich vorkommen, sowie durch neu bekannt gewordene Bestimmungen ergeben haben. Da die Tafeln schon einige Male, ohne auf diese Correctionen Rücksicht zu nehmen, angewandt sind, so glaube ich ausdrücklich erwähnen zu müssen, dass bei den Reductionen überall die corrigirten Tafeln benutzt wurden; ausserdem ist nach Astr. Nachr. Nr. 727 das k der Zone 16 um + 0.30 geändert und das der Zone 38 um -0.1115+0.004834 (N-46), wo N die Nummer des Sternes bezeichnet. Ferner nach einer Mittheilung von Argelander das der Zone 201 um -0.117 und der Zone 198 um -0.50 (th - 12h).

Auch ist anzunehmen, dass in Zukunft noch andere Tafeln Verbesserungen erhalten werden. Diese Rücksicht auf eine successive Verbesserung der Reductionstafeln machte eine Anordnung nothwendig, durch welche ihr Einfluss erhalten werden kann, ohne dass es nöthig wäre, jedesmal zur Beobachtung selbst zurückzugehen. Zu dem Ende ist in dem Kataloge jede reducirte Beobachtung selbst aufgenommen und ihr die Nummer der Zone beigefügt, welcher sie angehört, so dass, wenn die Correction für die Tafel dieser Zone ge-

geben ist, sei es nun, dass sie für die ganze Zone constant bleibt, oder sich selbst mit der Rectascension ändert, damit zugleich auch die Correction des Ortes gegeben ist. Noch mehrere andere Vortheile, welche diese Anordnung vor derjenigen voraus hat, die mehrfach beobachteten Sterne in ein Mittel zu vereinigen, sind so einleuchtend, dass sie hier nicht weiter erwähnt zu werden brauchen.

Hiernach ist nun die aussere Einrichtung des Kataloges die folgende geworden. Die erste Columne enthält die fortlaufende Nummer, wobei die Hunderte nur am Anfang und Ende jeder Seite gesetzt sind; jede Seite enthält 50 Nummern. Die zweite enthält die Grösse des Sternes, wie sie Argelander angibt. Die dritte und vierte die mittlere Rectascension und Declination für 1842. Die Stunde der erstern, oder die beiden Stunden, wenn dieselbe auf einer Seite wechselt, finden sich jedesmal als Columnentitel bemerkt. Die fünfte enthält die Nummer der Zone und die Nummer des Sternes in der Zone. Die letzte grössere Columne endlich dient zur Aufnahme von Bemerkungen, welche entweder Argelander selbst schon in den Zonen aufführt, oder erst später von mir hinzugefügte. Letztere sind durch ein beigesetztes O. von den erstern unterschieden. Die Bemerkungen von Argelauder beziehen sich vornehmlich entweder auf irgend eine Eigenthümlichkeit der Sterne, als Einfachheit oder Duplicität, Lage eines Sternes zu einem andern benachbarten aber nicht eigentlich beobachteten, Farbe, eigene Bewegung. Diese sind ungeändert aufgenommen. Oder sie beziehen sich auf mögliche Irrthümer und "zweifelhafte", so wie auf (z. B. durch Vergleichung mit andern Katalogen) corrigirte Beobachtungen. Zu den weniger sichern Beobachtungen sind auch die zu zählen, welche einen etwas grossen Unterschied in der Reduction der beobachteten Fäden zeigen, was in den Zonen jedesmal angeführt ist. Auf diese, sowie auf die schon von Argelander vorgenommenen Correcturen und auf einige wenige andere Bemerkungen, die unnöthig war, mit aufzuführen, ist nur durch ein beigefügtes \* verwiesen. Die Bemerkung »Beobachtung zweifelhaft« ist immer wiederholt.

Was die durch Irrthümer möglicherweise entstellten Beobachtungen betrifft, welche schon in den Zonen als solche bezeichnet sind, oder welche sich erst bei der Bildung des Katalogs als solche ergaben, so war es die Absicht, durch neuere Bestimmungen oder durch frühere, wenn solche vorhanden waren, die Richtigkeit der Zonenbeobachtung oder die der möglichen Correcturen zu entscheiden. Diess ist aber bis zu dem Beginne des Druckes leider nur bei einem, freilich dem grössern Theile, möglich gewesen, und wird also die Bekanntmachung der noch zu entscheidenden Beobachtungen einer andern Gelegenheit vorbehalten bleiben. Diese Bestimmungen

sind von mir am Meridiankreise und dem Aquatoriale der Wiener Sternwarte gemacht. Die noch unentschiedenen Beobachtungen sindnun ungeändert mit Hinzufügung des von Argelander erhobenen Zweifels in den Katalog aufgenommen. Diejenigen, welche entschieden werden konnten, sind beibehalten oder corrigirt, jenachdem die neue Bestimmung die Richtigkeit der frühern Beobachtung oder des entstandenen Zweifels bestätigte. Die Bemerkung gibt dann die Art der Correctur und worauf sie beruht. Die Aushängebogen wurden Herrn Director Argelander zugesendet, und hatte derselbe nicht nur die Güte, alle Bemerkungen sorgfältig durchzusehen und nachträglich zu erläutern, sondern auch sich zu erbieten, diejenigen Zweifel, welche sich etwa noch im ferneren Verlaufe der Arbeit ergaben, durch die Einsicht in die Rechnungen und Originalbeobachtungen wo möglich noch vor dem Drucke zu lösen. Den schätzenswerthen dadurch veranlassten Mittheilungen verdanken wir die Aufklärung über manche Zweifel, sowie eine Anzahl Verbesserungen. -

Es ist bisher üblich gewesen, den mittlern Positionen in den Fixsternkatalogen die Hülfsmittel beizufügen, welche zur Reduction derselben auf die mittlern Örter für irgend eine andere Epoche dienen, oder den Betrag der einjährigen Präcession für die Epoche des Katalogs und häufig auch die Änderung dieses Betrages im Laufe eines Jahres oder eines Jahrhunderts, in einigen Fällen auch die höhern Differentialquotienten, z. B. in Argelander's: Positiones mediae etc. In dem gegenwärtigen Kataloge fehlen diese Hülfsmittel und zwar aus folgenden Gründen:

Sollten dieselben überhaupt gegeben werden, so war es wünschenswerth, sie so genau zu geben, dass sie zur Reduction auf eine längere Reihe von Jahren völlig hinreichend waren; sie mussten, die einfache Präcession oder der mit der ersten Potenz der Zeit zu multiplicirende Coefficient bis auf 4 Decimalen in Rectascension Zeit, und 3 Decimalen Bogen für die Declination, und der mit dem Quadrate der Zeit zu multiplicirende Coefficient oder der 200. Theil von der sogenannten Säcularänderung der erstern auf 2 Stellen mehr gegeben sein. Dazu wären Tafeln nöthig gewesen bis auf dieselbe Anzahl von Stellen und in einer Ausdehnung, welche eine leichte Interpolation zuliess. Eine solche wurde nun für die Bestimmung der Präcession in Declination keine Schwierigkeit gemacht haben, da diese mit dem Argumente der Rectascension allein erhalten wird. Bei den Versuchen aber, die Pracessien in Rectascension in Tafeln zu bringen, zeigten sich bald Schwierigkeiten, die von den hohen Declinationen herrührten, und die sich selbst dann nicht hätten heben lassen, wenn man sich für die nördlichern Declinationen auch mit 3 Decimalen begnügt hätte. Am Ende der Einleitung folgt eine Tafel, die die Werthe der Präcession bis auf 2 Stellen liefert, und von der sogleich weiter die Rede sein wird. Eine Tafel auf 4 Stellen müsste bei gleich bleibenden Differenzen die 10 tausendfache Ausdehnung erhalten, d. h. sie würde in etwa 230 Bänden von dem Umfange des vorliegenden Platz finden oder eigentlich in der doppelten Anzahl, da die erwähnte Tafel nur die halbe Ausdehnung einer Tafel der wirklichen Präcessionen hat. Sie war daher unausführbar und hätte man grössere Differenzen zugelassen, um die Tafeln beträchtlich abzukürzen, so wurden jene so gross, dass die Tafeln ihrer Unbequemlichkeit wegen gar nicht benutzt werden konnten. Die directe Rechnung für alle Sterne würde viel kürzer gewesen sein; die auf diese verwendete Zeit und Mühe stand jedoch in keinem Verhältnisse zu ihrem Nutzen.

Aber selbst die Bestimmung des Coefficienten des zweiten Gliedes in der Entwicklung der Rectascension und Declination nach den Potenzen der Zeit hätte, namentlich für die Rectascension, Tafeln von überraschendem Umfange erfordert. Man überzeugt sich davon leicht, wenn man die Tafeln der jährlichen Änderung der Präcession oder des doppelten Goefficienten des zweiten Gliedes zur Hand nimmt, welche sich in den Madras Observations Vol. IV. befinden. Diese gehen für die Rectascension bis auf 4 Stellen, für unsern Zweck wären 6 Stellen, dann aber nur die halben Tafelwerthe nöthig gewesen, oder die Tafel hätte bei gleichen Differenzen die 2500, die gleiche Tafel für die Declination die 25fache Ausdehnung erhalten; sie waren also ebenfalls so gut wie unausführbar. Sie würden sich in dieser Ausdehnung freilich von 82 Grad nördlicher bis zur ebenso grossen südlichen Declination erstreckt haben; der bei weitem grösste Theil fällt aber auf die Declinationen über 45 Grad.

Ausser der erwähnten Tafel sind mir noch zwei bekannt, eine von Valz in den Astron. Nachr. Nr. 571, bei deren Gebrauch man aber mehrere Differenzreihen, und zwar in horizontaler und verticaler Richtung benutzen müsste und eine andere von Carlini in den Effem. di Milano 1820, welche die gesuchten Grössen aus 4 Tafeln für die Rectascension und eben so vielen für die Declination finden lassen, zu denen ausser der Rectascension und Declination 9 Argumente erst jedesmal gebildet werden müssen, von welchen eins selbst aus einer besonderen Tafel zu entnehmen; der Gebrauch derselben ist daher ebenfalls nicht bequem. — Sobald man aber den Coefficienten des ersten Gliedes bis auf 4 Stellen Rectascension Zeit, den des zweiten auf 6 Stellen angab, so musste consequent auch der Coefficient des dritten überall da gesetzt werden, wo derselbe den Betrag von 1 Einheit der 8 Stelle, in Declination 1 Einheit der 7. Stelle erreichte und würde ersteres schon von 45 Grad an der Fall gewesen

sein. Es betragen nämlich diese Werthe im Maximo, d. i. etwa für 6<sup>k</sup> für 82 81 80 79 78 77 76 75 74 73 72 71 70 65 60 55 50 45 Grad nördlicher Declination

nahe-235 172 131 103 82 67 56 47 40 35 30 26 23 14 9 6 4 3

Einheiten der 8. Stelle. Die Vernachlässigung des dritten Gliedes würde also z. B. bei einer Reduction auf 100 Jahre und bei 79° Declination einen Fehler von 1 Zeitsecunde hervorbringen können, für 58 Jahre oder von der Epoche des Katalogs bis zum Ende des gegenwärtigen Jahrhunderts 0.2 Secunden.

Durch das Vorhergehende hoffe ich die Weglassung der Reductionscoefficienten in dem Kataloge gerechtfertigt zu haben, glaube aber nichts desto weniger, dass die Benutzung desselben kaum unbequemer sein wird, als die anderer Kataloge, in denen die Präcessionen entweder nicht genau genug gegeben sind, oder in denen die zweiten Glieder fehlen. In diesem Falle dienen nämlich die Präcessionen nur dazu, um nach einer bekannten Methode den beiläufigen Ort des Sterns zu finden für die zwischen der Epoche des Kataloges und den Anfang eines bestimmten Jahres in die Mitte fallende Zeit. Mit diesem Orte und den für dieselbe Zeit gültigen Präcessionsconstanten wird die einjährige Präcession genau gerechnet; ihr Product mit der zwischen beiden Epochen verflossenen Anzahl Jahre ist die Reduction von der einen auf die andere. Dieses Verfahren ist nahe gleichbedeutend mit der Benutzung der beiden ersten Differentialquotienten, wenn man den driften = 0 setzen kann; es würde genau dasselbe sein, wenn man bei der Bildung des Ortes für die Mitte der beiden Zeiten nicht bloss die einfache Präcession, sondern noch deren Anderung berücksichtigt bätte. Diess würde leicht geschehen können, wenn man die Rechnung mit der nun gefundenen Anderung wiederholen würde. Dieser Einfluss wird aber im Allgemeinen zu vernachlässigen sein und wenn er in Folge einer grösseren Anzahl Jahre oder einer hohen Declination merklich wird, so wird auch das dritte Glied schon anfangen einen Einfluss zu äussern und wird man dann, wenn man nicht seine Zuflucht nehmen will zur genauen trigonometrischen Rechnung, sich die Örter für drei verschiedene Epochen ableiten oder für zwei von der Epoche des Kataloges merklich verschiedene und am besten gleichweit entfernte. Aus diesen findet man drei Werthe der einjährigen Präcessionen, welche zur Kenntniss des zweiten und dritten Differentialquotienten führen, mit denen sich nun, wenn man es für nöthig hält, die erste Rechnung wiederholen lässt. Dieses Verfahren ist besonders bequem, wenn man die mittleren Positionen schon in mehreren Katalogen vorfindet, deren Epochen weit von einander abstehen. Mehr hierüber findet sich in dem XIX.

Vol. der Mem. of the R. Astr. Soc. p. 127. Siehe auch: Mem. der Petersburger Academie. 3. Band 1844. S. 49 und Argelander: Positiones mediae etc. S. XII.

Die Kenntniss der beiläufigen Präcessionen, um nach der angeführten Methode die Örter auf die Mitte der beiden Zeiten zu reduciren, wird nun für den gegenwärtigen Katalog aus zwei Tafeln erhalten; die Präcession in Declination oder  $n\cos\alpha=20.055\cos\alpha$  auf 2 Decimalen aus Tafel II, von 2 zu 2 Zeitminuten. Für die Präcession in Rectascension oder:

$$\frac{m}{15} + \frac{n}{15} \sin \alpha \tan \beta = 3.070 + 1.337 \sin \alpha \tan \beta$$

ist nur der zweite Theil in eine Tafel mit dem doppelten Eingange  $\alpha$  und  $\delta$  gebracht bis auf 2 Stellen, deren Werthe also mit dem richtigen Zeichen zu 3.07 hinzugelegt, die Präcessionen selbst liefern. Die Intervalle der Argumente sind so gewählt, dass die Differenzen der Tafelwerthe wenigstens nach einer Richtung klein ausfallen. Da die Änderung von n im Laufe eines Jahrhunderts etwa -0.01, die von m=+0.03 beträgt, so sieht man, dass die Zahlen der Tafel II für ein Jahrhundert früher oder später im Maximo sieh erst um eine Einheit der letzten Stelle ändern, die der Tafel I für 81 Grad Declination erst um 0.6 Einheiten, so dass die Tafeln auch für ziemlich entlegene Epochen noch ungeändert zu demselben Zwecke benutzt werden können.

Da die Reduction vom gegenwärtigen Kataloge auf die von Piazzi und Lalande (1800), Groombridge (1810), Argelander und Pond (1830), Bessel (1825), Taylor (1835), Rümker (1836), häufiger vorkommen dürfte, so folgen hier noch zur Abkürzung der Rechnung die Reductionsformeln für die verschiedenen Jahre t odze:

$$(t-1842)\frac{m}{15}+(t-1842)\frac{n}{15}\sin\alpha \ tang\ \delta$$
 in Rectascension und  $(t-1842)n\cos\alpha$  in Declination,

wobei m und n mit der Epoche  $\frac{1842+t}{2}$  aus den Tab. Reg. genommen sind.

#### Reduction von 1842.

auf	in Rectascension	in Declination
1800	-2 <sup>m</sup> 8.*940 [1.749435] sin α tang δ	$-[2.925527]\cos\alpha$
1810	-1 38.244 - [1.631325] sin α tang δ	- [2.807417] cos α
1825	- 52.195 - [1.356609] $\sin \alpha \tan \delta$	$-[2.532701]\cos \alpha$
1830	- $36.844$ - $[1.205335]$ sin $\alpha$ tang $\delta$	[2.381427] cos α
1835	— 21.493 — [0.971247] sin α tang δ	$[2.147339]\cos \alpha$
1836	- 18.422 - $[0.904299]$ sin $\alpha$ tang $\delta$	$-[2.080391]\cos \alpha$

Die eingeschlossenen Zahlen bedeuten Logarithmen,  $\alpha$  und  $\delta$  ist das Mittel aus den Positionen der beiden Kataloge.

Die Reduction von dem Bradley'schen Kataloge oder von 1755 auf 1842 wird man wünschen mit Benutzung auch des dritten Difterentialquotienten auszuführen und geschieht diess auf folgende Weise: Die Reduction von einer Epoche T auf eine andere nach  $\tau$  Jahren ist:

$$R = \frac{\partial x}{\partial t} \tau + \frac{1}{2} \frac{\partial^2 x}{\partial t^2} \tau^2 + \frac{1}{6} \frac{\partial^2 x}{\partial t^2} \tau^2,$$

wo x einmal die Rectascension, ein anderes mal die Declination für die Zeit T bedeutet, oder wenn  $p_1$  die Präcession für diese Epoche bezeichnet,

$$R = p_i \tau + \frac{1}{2} \frac{\partial p_i}{\partial t} \tau^2 + \frac{1}{6} \frac{\partial^2 p_i}{\partial t^2} \tau^3.$$

Ist nun  $p_s$  die Präcession für eine um  $t_s$  und  $p_s$  dieselbe für eine um  $t_s$  Jahre verschiedene Epoche, so ist:

$$p_{s} = p_{i} + \frac{\partial p_{i}}{\partial t} t_{s} + \frac{1}{2} \frac{\partial^{3} p_{i}}{\partial t^{3}} t_{s}^{2}$$

$$p_{s} = p_{i} + \frac{\partial p_{i}}{\partial t} t_{s} + \frac{1}{2} \frac{\partial^{3} p_{i}}{\partial t^{3}} t_{s}^{2}.$$

Sucht man aus diesen beiden Gleichungen  $\frac{\partial p_1}{\partial t}$  und  $\frac{\partial^2 p_2}{\partial t^2}$ , und substituirt ihre Werthe in die zweite Gleichung für R, so erhält man:

$$R = \frac{t_{1} t_{1} (4t_{2} - 3t_{3}) - t_{2}^{2}}{6t_{1} (t_{1} - t_{3})} p_{1} + \frac{t_{2}^{2}}{6t_{1} (t_{3} - t_{3})} p_{2} + \frac{t_{3} (2t_{3} - 3t_{3})}{6(t_{3} - t_{3})} p_{3}.$$

Aus dem Kataloge der Fund. Astr. kennt man nun die Präcessionen für 1755 und 1800:  $p_1$  und  $p_2$ , die dritte  $p_3$  ist die für 1842 berechnete; also ist  $t_3 = +45$ ,  $t_4 = +87$  und damit erhält man:

$$R = 15.4667 p_1 + 58.06905 p_2 + 13.4643 p_3$$

für eine Reduction von 1755 auf 1842.

Da  $p_*$  als mit den Constanten der *Tabulae Regiom*. berechnet angenommen ist, den Werthen  $p_*$  und  $p_*$  aber andere Constanten zu

Grunde liegen, so würde man die beiden Präcessionen der Fund. zu ändern haben in Rectascension um  $\Delta m + \Delta n \sin \alpha \tan \beta$ , in Declination um  $\Delta n \cos \alpha$ , wenn  $\Delta m$  und  $\Delta n$  die Werthe bezeichnen, welche an die Constanten der Fund. anzubringen sind, um die der Tab. Reg. zu erhalten. Diesen Einfluss kann man aber durch eine Änderung der Coefficienten von  $p_1$  und  $p_2$  der obigen Gleichung in Rechnung bringen.

Ist nämlich:  $p = m + n \sin \alpha \tan \beta$   $\Delta p = \Delta m + \Delta n \sin \alpha \tan \beta$ 

so wird durch Elimination von sin a tang d

$$\Delta p = \Delta m - \frac{m}{n} \Delta n + \frac{p}{n} \Delta n.$$

Ferner in Declination:

$$p' = n \cos \alpha$$

$$\Delta p' = \Delta n \cos \alpha$$

$$\Delta p' = \Delta n \frac{p'}{n}.$$

Setzt man nun  $p_1 + \Delta p_1$  an die Stelle von  $p_1$  und  $p_2 + \Delta p_2$  statt  $p_3$ , so erhält man:

 $R = 15.47749 p_1 + 58.10967 p_2 + 13.4643 p_3$ , we nun  $p_1$  und  $p_2$  die in den *Fund*. unmittelbar gegebenen Werthe der Präcession in Rectascension oder Declination bedeuten,

 $p_*$  abor in Rectascension = 46.057 + [1.30224]  $\sin \alpha \tan \delta$ 

in Declination = [1.30224]  $\cos \alpha$  ist, wenn  $\alpha$  und  $\delta$  die Coordinaten aus dem gegenwärtigen Kataloge bezeichnen. Für die Rectascension kommt eigentlich noch ein constantes Glied hinzu, das aber wegfällt, da es nicht den Werth von  $\frac{1}{100}$  Bogensecunde erreicht.

In Logarithmen ist:

 $R = [1.189700] p_1 + [1.764248] p_2 + [1.129184] p_3$  in Bogensecunden. —

Die Übersicht üher die in den verschiedenen Stunden enthaltene Anzahl Sterne, sowie einige andere dahin gehörige Zusammenstellungen behalte ich mir vor, nach Beendigung des Ganzen zu liefern.

### Erläuterung und Gebrauch der Tafein.

Die Tafel I. gibt die Werthe von  $\frac{n}{15}$  sin  $\alpha$  tang  $\delta$ , wobei  $\frac{n}{15}$  = 1.337. Die Zahlen der Tafel bedeuten Hundertel. Legt man sie mit dem richtigen Zeichen zu  $\frac{m}{15}$  = 3.07, so erhält man die beiläufige einjährige Präcession im Rectascension Zeit. Tafel II. enthält die Werthe der Präcession in Declination = 20.055 cos  $\alpha$ .

Bezeichnen also  $\alpha$  und  $\delta$  die Rectascension und Declination aus dem Kataloge,  $\alpha'$  und  $\delta'$  dieselben Grössen für die Zeit t, so nehme man aus Tafel I. 1.337 sin  $\alpha$  tang  $\delta$ , aus Tafel II. 20.055 cos  $\alpha$  und berechne:

$$A = \alpha + \frac{t - 1842}{2} (3.07 + 1.337 \sin \alpha \tan \delta)$$

$$D = \delta + \frac{t - 1842}{2} 20.055 \cos \alpha$$

dann ist:

$$\alpha' = \alpha + (t - 1842) \left( \frac{m''}{15} + \frac{n}{15} \sin A \tan B \right)$$

$$\delta' = \delta + (t - 1842) n \cos A.$$

wobei m und n mit der Epoche  $\frac{1842 + \ell}{2}$  aus dem folgenden, den Tab. Reg. entlehnten Täfelchen genommen werden:

• . •	$\frac{1}{15}m$	$log \frac{1}{15}n$	log n

## Zusätze und Verbesserungen.

Seite 10 Note 3) statt 57.591 lies 57.581.
» 13 » 1) sollte besser heissen: Nach einer Wien. Mer. Beobacht. ist die
Zeitminute um — 1 corrigirt.
» 27 » 1) und 4) fallen weg nach Wien. Mer. Beobachtungen.
» 54 » 1) sollte heissen: Die Position ist corrigirt auf die von Arg. ange-
gebene Art.
» 58 » 1) hinzuzufügen: Nach einer Beob. am Wien. Äquat. ist Nr. 2889
richtig, Nr. 2882, 2886 und 2896 aber um + 1 2 zu eorrigiren.
» 59 » 1) fällt weg nach einer Beob. am Wien. Äquat.
» 64 » 1) Arg. hält die Corr. der Decl. in 33."7 für möglich.
» 71 » 1) hinzuzufügen: Eine Wien. Mer. Beob. gibt 36. 50.
» 77 » ¹) » » » » 26.*55.
" 78 " <sup>3</sup> ) und Seite 79 Note <sup>1</sup> ) fallen weg nach Wien. Mer. Beobachtungen.
